17. (Currently Amended) A gate turn-off thyristor of a wide-gap semiconductor, comprising:

- a first emitter layer <u>ofcomprising</u> either one of n-type and p-type conductive types <u>and</u> having a first electrode on its one surface;
- a first base layer <u>of-comprising</u> a conductive type different from that of the first emitter layer <u>and provided</u> on the <u>an</u>other surface of the first emitter layer;
- a second base layer <u>of comprising</u> a conductive type identical to that of the first emitter layer <u>and provided</u> on the first base layer;
- a mesa-type second emitter layer of comprising a conductive type different from that of the first emitter layer and provided on the second base layer in a manner whereby a flat interface is formed between the second emitter layer and the second base layer;
 - a second electrode provided on the mesa-type second emitter layer;
- a low-resistance gate region provided embedded in the second base layer below a bottom surface of a mesa the interface and spaced away from the interface in a stacking direction, the stacking direction being perpendicular to the interface and having, the low-resistance gate region comprising a conductive type identical to that of the second base layer and an impurity concentration higher than that of the second base layer; and
- a third electrode put in contact with the low-resistance gate region via a gate contact region, wherein
- a volume comprising the second base layer has homogeneous impurity concentration, the volume extending between the interface and a lower layer upon which the second base layer is formed.
- 18. (CANCELLED)
- 19. (CANCELLED)

20. (Withdrawn) The gate turn-off thyristor of a wide-gap semiconductor as claimed in claim 17, further comprising:

Atty. Dkt.: 925-327 Art Unit: 2814

a region having a conductive type identical to that of the second emitter layer and provided in the second base layer in the neighborhood of the end portion of the junction between the second base layer and the second emitter layer.

21. (Withdrawn) A gate turn-off thyristor of a wide-gap semiconductor, comprising:

a first emitter layer of either one of n-type and p-type conductive types having a first electrode on its one surface;

a first base layer of a conductive type different from that of the first emitter layer provided on the other surface of the first emitter layer;

a second base layer of a conductive type identical to that of the first emitter layer provided on the first base layer;

a mesa-type second emitter layer of a conductive type different from that of the first emitter layer provided on the second base layer;

a second electrode provided on the mesa-type second emitter layer; and

a low-resistance gate region having a conductive type identical to that of the second base layer and provided at a bottom portion of a mesa that includes a neighborhood of a junction between the mesa-type second emitter layer and the second base layer in a neighborhood of a surface of the second base layer, with interposition of a region of a conductive type identical to that of the second emitter layer between the low-resistance gate region and an end portion of the junction.

- 22. (Withdrawn) A gate turn-off thyristor of a wide-gap semiconductor, comprising:
- a first emitter layer of either one of n-type and p-type conductive types having a first electrode on its one surface;
- a first base layer of a conductive type different from that of the first emitter layer provided on the other surface of the first emitter layer;
- a second base layer of a conductive type identical to that of the first emitter layer provided on the first base layer;
- a mesa-type second emitter layer of a conductive type different from that of the first emitter layer provided on the second base layer;
 - a second electrode provided on the mesa-type second emitter layer;
- a low-resistance region having a conductive type identical to that of the second base layer and provided in a position located apart from the junction between the mesatype second emitter layer and the second base layer in a neighborhood of a surface of the second base layer;
 - a third electrode put in contact with the low-resistance region; and
- a region of a conductive type identical to that of the second emitter layer provided in the second base layer in the neighborhood of the end portion of the junction between the second base layer and the second emitter layer.
- 23. (Withdrawn) A gate turn-off thyristor of a wide-gap semiconductor, comprising:
- a first emitter layer of either one of n-type and p-type conductive types having a first electrode on its one surface;
- a first base layer of a conductive type different from that of the first emitter layer provided on the other surface of the first emitter layer;
- a second base layer of a conductive type identical to that of the first emitter layer provided on the first base layer;
- a mesa-type second emitter layer of a conductive type different from that of the first emitter layer provided on the second base layer; and
 - a second electrode provided on the mesa-type second emitter layer, wherein

Atty. Dkt.: 925-327 Art Unit: 2814

the second base layer is formed into a mesa type, and a low-resistance gate region of a conductive type identical to that of the second base layer is formed in the first base layer so that the region surrounds the mesa-type second base layer.

24. (withdrawn) The gate turn-off thyristor of a wide-gap semiconductor as claimed in claim 23, further comprising:

at least one low-resistance small region of a conductive type identical to that of the low-resistance gate region formed inside the low-resistance gate region.

25. (Previously Presented) The gate turn-off thyristor of a wide-gap semiconductor as claimed in claim 17, wherein

the first emitter layer is an n-type cathode emitter layer, the first base layer is a p-type base layer, the second base layer is an n-type base layer, the second emitter layer is a p-type anode emitter layer, and the low-resistance gate region is an n-type, and

the first, second and third electrodes are a cathode electrode, an anode electrode and a gate electrode, respectively.

26. (Withdrawn) The gate turn-off thyristor of a wide-gap semiconductor as claimed in claim 17, wherein

the first emitter layer is a p-type anode emitter layer, the first base layer is an n-type base layer, the second base layer is a p-type base layer, the second emitter layer is an n-type cathode emitter layer, and the low-resistance gate region is a p-type, and

the first, second and third electrodes are an anode electrode, a cathode electrode and a gate electrode, respectively.

Atty. Dkt.: 925-327 Art Unit: 2814 Serial No. 10/552,268

27. (Previously Presented) The gate turn-off thyristor of a wide-gap semiconductor as claimed in claim 17, wherein

the wide-gap semiconductor is silicon carbide (SiC).

28. (Previously Presented) The gate turn-off thyristor of a wide-gap semiconductor as claimed in claim 17, wherein

an impurity concentration of the low-resistance gate region is three or more times an impurity concentration of the base region.

29. (CANCELLED)

- 30. (Withdrawn) A gate turn-off thyristor of a wide-gap semiconductor, comprising:
- a first emitter layer of either one of n-type and p-type conductive types having a first electrode on its one surface;
- a first base layer of a conductive type different from that of the first emitter layer provided on the other surface of the first emitter layer;
- a second base layer of a conductive type identical to that of the first emitter layer provided on the first base layer;
- a mesa-type second emitter layer of a conductive type different from that of the first emitter layer provided on the second base layer;
- a contact electrode put in contact with the mesa-type second emitter layer in a region excluding a central region of the second emitter layer;
- a low-resistance region provided so as to surround the mesa-type second emitter layer in a region located apart from an end portion of a junction between the mesa-type second emitter layer and the second base layer, the low-resistance region having a conductive type identical to that of the second base layer and an impurity concentration higher than that of the second base layer; and

a second electrode put in contact with an end portion of the low-resistance region.

31. (Withdrawn) A gate turn-off thyristor of a wide-gap semiconductor, comprising:

a first emitter layer of either one of n-type and p-type conductive types having a first electrode on its one surface;

Art Unit: 2814

a first base layer of a conductive type different from that of the first emitter layer provided on the other surface of the first emitter layer;

a second base layer of a conductive type identical to that of the first emitter layer provided on the first base layer;

a mesa-type second emitter layer of a conductive type different from that of the first emitter layer provided on the second base layer;

a high-resistance region provided in a central region of an upper surface of the second emitter layer and having a conductive type identical to that of the second emitter layer and an impurity concentration lower than that of the second emitter layer;

a second electrode put in contact with the second emitter layer and the highresistance region;

a low-resistance region provided in a region located apart from an end portion of a junction between the mesa-type second emitter layer and the second base layer so that the region surrounds the mesa-type second emitter layer, the low-resistance region having a conductive type identical to that of the second base layer and an impurity concentration higher than an impurity concentration of the second base layer; and

a third electrode put in contact with an end portion of the low-resistance region.

32. (Withdrawn) A gate turn-off thyristor of a wide-gap semiconductor, comprising:

Atty. Dkt.: 925-327 Art Unit: 2814

a first emitter layer of either one of n-type and p-type conductive types having a first electrode on its one surface;

a first base layer of a conductive type different from that of the first emitter layer provided on the other surface of the first emitter layer;

a second base layer of a conductive type identical to that of the first emitter layer provided on the first base layer;

a mesa-type second emitter layer of a conductive type different from that of the first emitter layer provided on the second base layer;

a region of a conductive type different from that of the second emitter layer provided in a central region of an upper surface of the mesa-type second emitter layer; and

a second electrode located opposite to the second emitter layer and the region via at least a contact electrode.

33. (Withdrawn) A gate turn-off thyristor of a wide-gap semiconductor, comprising:

a first emitter layer of either one of n-type and p-type conductive types having a first electrode on its one surface;

a first base layer of a conductive type different from that of the first emitter layer provided on the other surface of the first emitter layer;

a second base layer of a conductive type identical to that of the first emitter layer provided on the first base layer;

a heavily doped region provided in a central region of a surface of the second base layer and having a conductive type identical to that of the second base layer and an impurity concentration higher than that of the second base layer;

a mesa-type second emitter layer provided on the second base layer and the heavily doped region and having a conductive type different from that of the first emitter layer; and a second electrode put in contact with the mesa-type second emitter layer at least via a contact electrode.

34. (New) The gate turn-off thyristor of a wide-gap semiconductor as claimed in claim 17, wherein

the gate contact region is located between the low-resistance gate region and the third electrode with respect to the stacking direction perpendicular to the surface direction and is apart from the second emitter layer with respect to the surface direction, and has a conductive type identical to that of the second base layer and an impurity concentration higher than an impurity concentration of the low-resistance gate region.

35. (New) The gate turn-off thyristor of a wide-gap semiconductor as claimed in claim 17, wherein

an outer circumference pattern of the second emitter layer is in correspondence with an inner circumference pattern of the low-resistance gate region with respect to the surface direction.
